

Medical Report

Report ID: recording_1766059259645

Patient Name: Hamza Al-Maghribi

Age: 20

Sex: N/A

Exam Type: N/A

Date: N/A

Clinical History

Patient Profile: Hamza Al-Maghribi, 20 years old, unmarried, occupation: trader. Chief Complaint: Loss of control on the right side of the face for 2 weeks. History of Present Illness: The patient reports complete loss of movement on the right side of the face, with numbness lasting about an hour and loss of taste sensation at the tip of the tongue. No exposure to cold air or drafts is recalled. No medication or corticosteroid use. No trauma, infection, or inflammation reported. No previous similar episodes. Systemic Enquiry: No other symptoms reported in other systems. Past Medical and Surgical History: No previous hospitalizations or surgeries. Drug History: No current or regular medication use. Family History: No similar conditions or hereditary diseases reported. Social History: Lives on the second floor in Al-Zaqa. Works as a trader. No functional limitations reported.

Detailed Findings

- Complete loss of movement on the right side of the face — Indicates possible facial nerve involvement, likely Bell's palsy or similar condition.
- Numbness on the right side of the face lasting about an hour — Transient sensory disturbance, possibly related to nerve involvement.
- Loss of taste sensation at the tip of the tongue — Suggests involvement of the chorda tympani nerve, a branch of the facial nerve.

Impression Summary

The clinical presentation is consistent with a peripheral facial nerve palsy, likely Bell's palsy, given the acute onset of unilateral facial paralysis, transient numbness, and loss of taste sensation. No evidence of systemic or infectious causes was reported.

Recommendations

- Consider referral to a neurologist for further evaluation.
- Initiate corticosteroid therapy if Bell's palsy is confirmed.
- Advise on eye care to prevent corneal damage due to incomplete eyelid closure.

Urgency Level: moderate
