

Medical Report (FINAL_ASSESSMENT)

Patient: ahmad mohammad

Age: 33 | **Sex:** Male

Exam Type: Clinical Examination

Exam Date:

Clinical History

33-year-old male presents with initial complaint of right shoulder pain, diagnosed as a shoulder dislocation. The shoulder was subsequently repositioned, and anti-inflammatory medications were prescribed.

Findings

- **Right shoulder pain:** Patient initially presented with pain in the right shoulder, indicative of musculoskeletal discomfort.
- **Shoulder dislocation:** Clinical examination initially revealed a dislocation in the right shoulder, confirmed as structural displacement of the joint.
- **Shoulder repositioned:** The dislocated shoulder was successfully repositioned during clinical follow-up.
- **Anti-inflammatory medication prescribed:** Post-repositioning, medications were prescribed to manage inflammation and alleviate pain.

Impression

The patient presented with a dislocated right shoulder, which was successfully repositioned. Post-procedural recovery is supported with anti-inflammatory medications. Clinical findings suggest effective management of the acute episode.

Recommendations

- Continue anti-inflammatory medications as prescribed.
- Follow-up appointment in one week to monitor pain and function of the shoulder.
- Consider physical therapy if symptoms persist beyond follow-up.
