

Medical Report (FINAL_ASSESSMENT)

Patient: ahmad mohammad

Age: 33 | **Sex:** Male

Exam Type: Clinical Examination

Exam Date:

Clinical History

33-year-old male presents with a history of right shoulder pain following an unspecified mechanism of injury. Since the initial clinical examination, the patient's shoulder was found to be dislocated and has been successfully repositioned. The patient was prescribed anti-inflammatory medication post-procedure.

Findings

- **Right shoulder pain:** Pain persists in the right shoulder, consistent with musculoskeletal discomfort likely exacerbated by the recent dislocation.
- **Shoulder dislocation:** Clinical examination initially revealed a dislocation which has since been successfully repositioned.
- **Shoulder repositioned:** The dislocated right shoulder has been successfully repositioned, alleviating some of the acute symptoms.
- **Anti-inflammatory medication prescribed:** Post-procedural management included the prescription of anti-inflammatory medication to manage inflammation and pain.

Impression

The patient presented with a dislocated right shoulder, which has been successfully repositioned. The clinical findings suggest effective management of the acute episode. Continued use of anti-inflammatory medication is recommended to manage residual pain and inflammation.
